CSIR UGC NET EXAM (JUNE 2013) Q. 68

Let  $X_1, \dots, X_n$  be independent and identically distributed random variables with probability density function

$$f(x) = \frac{1}{2} \lambda^3 x^2 e^{-\lambda x}; x > 0; \lambda > 0 \quad (0.0.1)$$

Then which of the following statements are true?

- 1)  $\frac{2}{n} \sum_{i=1}^n \frac{1}{X_i}$  is an unbiased estimator of  $\lambda$
- 2)  $\frac{3n}{\sum_{i=1}^n X_i}$  is an unbiased estimator of  $\lambda$
- 3)  $\frac{2}{n} \sum_{i=1}^n \frac{1}{X_i}$  is a consistent estimator of  $\lambda$
- 4)  $\frac{3n}{\sum_{i=1}^n X_i}$  is a consistent estimator of  $\lambda$

SOLUTION

**Definition 0.1.** An **estimator** is a statistic that estimates some fact about the population. The quantity that is being estimated is called the **estimand**.

**Definition 0.2.** Let  $\Theta = h(X_1, X_2, \dots, X_n)$  be a point estimator for  $\theta$ . The **bias** of the estimator  $\Theta$  is defined by

$$B(\Theta) = E[\Theta] - \theta \quad (0.0.2)$$

where  $E[\Theta]$  is the expectation value of the estimator  $\Theta$  and  $\theta$  is the estimand.

**Definition 0.3.** Let  $\Theta = h(X_1, X_2, \dots, X_n)$  be a point estimator for a parameter  $\theta$ . We say that  $\Theta$  is an **unbiased estimator** of  $\theta$  if

$$B(\Theta) = 0, \text{ for all possible values of } \theta. \quad (0.0.3)$$

**Definition 0.4.** Let  $\Theta_1, \Theta_2, \dots, \Theta_n, \dots$ , be a sequence of point estimators of  $\theta$ . We say that  $\Theta_n$  is a **consistent** estimator of  $\theta$ , if

$$\lim_{n \rightarrow \infty} \Pr(|\Theta_n - \theta| \geq \epsilon) = 0, \text{ for all } \epsilon > 0. \quad (0.0.4)$$

**Definition 0.5.** The **mean squared error (MSE)** of a point estimator  $\Theta$ , shown by  $MSE(\Theta)$ , is defined as

$$MSE(\Theta) = E[(\Theta - \theta)^2] \quad (0.0.5)$$

$$= Var(\Theta) + B(\Theta)^2 \quad (0.0.6)$$

where  $B(\Theta)$  is the bias of  $\Theta$ .

**Theorem 0.1.** Let  $\Theta_1, \Theta_2, \dots$  be a sequence of point estimators of  $\theta$ . If

$$\lim_{n \rightarrow \infty} MSE(\Theta_n) = 0, \quad (0.0.7)$$

then  $\Theta_n$  is a consistent estimator of  $\theta$ .

**Definition 0.6.** The **moment generating function (MGF)** of a random variable  $X$  is a function  $M_X(s)$  defined as

$$M_X(s) = E[e^{sX}]. \quad (0.0.8)$$

**Lemma 0.2.** A well known result of Integratin by Parts is

$$\int_0^\infty x^a e^{-bx} dx = \frac{\Gamma(a+1)}{b^{a+1}} \quad (0.0.9)$$

where  $\Gamma(a) = (a-1)!$  for  $a \in \mathbb{Z}$

**Theorem 0.3.** The Moment generating function of a gamma distribution with PDF as,

$$f_X(x) = \begin{cases} \frac{\lambda^\alpha x^{\alpha-1} e^{-\lambda x}}{\Gamma(\alpha)} & x > 0 \\ 0 & \text{otherwise} \end{cases} \quad (0.0.10)$$

where  $\Gamma(\alpha) = \frac{1}{(\alpha-1)!}$  is given by,

$$M_X(s) = \left( \frac{\lambda}{\lambda - s} \right)^\alpha \quad (0.0.11)$$

*Proof.*

$$M_X(s) = E[e^{sX}] \quad (0.0.12)$$

$$= \int_{-\infty}^{\infty} e^{sx} f(x) dx \quad (0.0.13)$$

$$= \int_0^{\infty} e^{sx} \frac{1}{\Gamma(\alpha)} \lambda^\alpha x^{\alpha-1} e^{-\lambda x} dx \quad (0.0.14)$$

$$= \frac{\lambda^\alpha}{\Gamma(\alpha)} \int_0^{\infty} x^{\alpha-1} e^{-(\lambda-s)x} dx \quad (0.0.15)$$

From lemma 0.2 we have,

$$\int_0^{\infty} x^a e^{-bx} dx = \frac{\Gamma(a+1)}{b^{a+1}} \quad (0.0.16)$$

Making this substitution we get,

$$\int_0^{\infty} x^{\alpha-1} e^{-(\lambda-s)x} dx = \frac{\Gamma(\alpha)}{(\lambda-s)^\alpha} \quad (0.0.17)$$

Therefore,

$$M_X(s) = \frac{\lambda^\alpha}{\Gamma(\alpha)} \times \frac{\Gamma(\alpha)}{(\lambda-s)^\alpha} \quad (0.0.18)$$

$$= \left( \frac{\lambda}{\lambda-s} \right)^\alpha \quad (0.0.19)$$

□

**Theorem 0.4.** The MGF (if it exists) uniquely determines the distribution. That is, if two random variables have the same MGF, then they must have the same distribution.

**Lemma 0.5.** If  $X_i$  for  $i = 1, 2, \dots, n$  are independent and identically distributed random variables (i.i.ds), then we have the following property,

$$\text{Var} \left( a \sum_{i=1}^n g(X_i) \right) = a^2 \sum_{i=1}^n \text{Var}(g(X_i)) \quad (0.0.20)$$

**Lemma 0.6.** One of the property of gamma distributions states that,

$$\int_0^{\infty} \lambda^\alpha t^{\alpha-1} e^{-\lambda t} dt \quad (0.0.21)$$

$$= \frac{1}{\Gamma(\alpha)} \quad (0.0.22)$$

**Lemma 0.7.** The expected value of  $\frac{1}{\bar{X}}$  with distribution of X from equation (0.0.1) is

$$E \left[ \frac{1}{\bar{X}} \right] = \frac{n\lambda}{3n-1} \quad (0.0.23)$$

*Proof.* Let r.v.  $T$  be,

$$T = \sum_{i=1}^n X_i \sim \Gamma(3n, \lambda) \quad (0.0.24)$$

with pdf,

$$f_T(t) = \frac{\lambda^{3n} t^{3n-1} e^{-\lambda t}}{\Gamma(3n)}, t > 0 \quad (0.0.25)$$

Using,  $\frac{1}{\bar{X}} = \frac{n}{T}$

$$E \left[ \frac{1}{\bar{X}} \right] = \int_0^{\infty} \frac{n}{t} \frac{1}{\Gamma(3n)} \lambda^{3n} t^{3n-1} e^{-\lambda t} dt \quad (0.0.26)$$

$$= \frac{n\lambda}{(3n-1)} \int_0^{\infty} \frac{1}{\Gamma(3n-1)} \lambda^{3n-1} t^{3n-2} e^{-\lambda t} dt \quad (0.0.27)$$

Using lemma 0.6 we have,

$$\int_0^{\infty} \frac{1}{\Gamma(3n-1)} \lambda^{3n-1} t^{3n-2} e^{-\lambda t} dt = 1 \quad (0.0.28)$$

Using equations (0.0.28) and (0.0.27) we have,

$$E \left[ \frac{1}{\bar{X}} \right] = \frac{n\lambda}{3n-1} \quad (0.0.29)$$

□

**Corollary 0.7.1.** The expected value of  $\frac{1}{\bar{X}_i}$  with distribution of X from equation (0.0.1) is calculated by substituting  $n = 1$  in lemma 0.7 as,

$$E \left[ \frac{1}{\bar{X}_i} \right] = \frac{1 \times \lambda}{3-1} \quad (0.0.30)$$

$$= \frac{\lambda}{2} \quad (0.0.31)$$

**Lemma 0.8.** The variance of  $\frac{1}{\bar{X}}$  with distribution of X from equation (0.0.1) is

$$\text{Var} \left( \frac{1}{\bar{X}} \right) = \frac{n^2 \lambda^2}{(3n-1)^2 (3n-2)} \quad (0.0.32)$$

*Proof.* Similar to lemma 0.7 we have, rv  $T$

$$\text{Var} \left( \frac{1}{\bar{X}} \right) = \left( E \left[ \frac{1}{\bar{X}}^2 \right] - E \left[ \frac{1}{\bar{X}} \right]^2 \right) \quad (0.0.33)$$

To calculate,  $E \left[ \frac{1}{\bar{X}}^2 \right]$  we use,

$$\frac{1}{\bar{X}}^2 = \frac{n^2}{t^2} \quad (0.0.34)$$

$$E\left[\frac{1}{\bar{X}}\right] = \int_0^\infty \frac{n^2}{t^2} \frac{1}{\Gamma(3n)} \lambda^{3n} t^{3n-1} e^{-\lambda t} dt \quad (0.0.35)$$

$$= \frac{n^2 \lambda^2}{(3n-1)(3n-2)} \times (1) \quad (0.0.36)$$

As from lemma 0.6 we have,

$$\int_0^\infty \frac{1}{\Gamma(3n-2)} \lambda^{3n-2} t^{3n-3} e^{-\lambda t} dt = 1 \quad (0.0.37)$$

Therefore,

$$Var\left(\frac{1}{\bar{X}}\right) = \left(\frac{n^2 \lambda^2}{(3n-1)(3n-2)} - \frac{n^2 \lambda^2}{(3n-1)^2}\right) \quad (0.0.38)$$

$$= \frac{n^2 \lambda^2}{3n-1} \left(\frac{1}{3n-2} - \frac{1}{3n-1}\right) \quad (0.0.39)$$

$$= \frac{n^2 \lambda^2}{(3n-1)^2(3n-2)} \quad (0.0.40)$$

□

**Corollary 0.8.1.** The variance of  $\frac{1}{X_i}$  with distribution of X from equation (0.0.1) is calculated by substituting  $n = 1$  in lemma 0.8 as,

$$Var\left(\frac{1}{X_i}\right) = \frac{1^2 \lambda^2}{(3-1)^2(3-2)} \quad (0.0.41)$$

$$= \frac{\lambda}{4} \quad (0.0.42)$$

### Solving all options :

1) Now here we have our estimator  $\Theta$  and estimand  $\theta$  as,

$$\Theta = \frac{2}{n} \sum_{i=1}^n \frac{1}{X_i} \text{ and } \theta = \lambda \quad (0.0.43)$$

The expectation value of the estimator is given by,

$$E[\Theta] = E\left[\frac{2}{n} \sum_{i=1}^n \frac{1}{X_i}\right] \quad (0.0.44)$$

$$= \frac{2}{n} \sum_{i=1}^n E\left[\frac{1}{X_i}\right] \quad (0.0.45)$$

$$(0.0.46)$$

Using corollary 0.7.1

$$E[\Theta] = \frac{2n}{n} \times \frac{\lambda}{2} \quad (0.0.47)$$

$$= \lambda \quad (0.0.48)$$

So the bias of estimator is given by,

$$B(\Theta) = E[\Theta] - \theta \quad (0.0.49)$$

$$= \lambda - \lambda = 0 \quad (0.0.50)$$

Therefore  $\frac{2}{n} \sum_{i=1}^n \frac{1}{X_i}$  is an unbiased estimator of  $\lambda$

Option 1 is correct.

2) Now in this option we have our estimator  $\Theta$  and quantity to be estimated  $\theta$  as,

$$\Theta = \frac{3n}{\sum_{i=1}^n X_i} \text{ and } \theta = \lambda \quad (0.0.51)$$

We have that sample mean,  $\bar{X}$ ,

$$\bar{X} = \frac{X_1 + X_2 + \dots + X_n}{n} \quad (0.0.52)$$

$$= \frac{\sum_{i=1}^n X_i}{n} \quad (0.0.53)$$

Therefore estimator,

$$\Theta = \frac{3n}{n\bar{X}} = \frac{3}{\bar{X}} \quad (0.0.54)$$

To check the distribution is gamma or not we calculate, MGF, i.e.,  $M_X(s)$  for random variable,  $X$

$$M_X(s) = E[e^{sX}] \quad (0.0.55)$$

Using theorem 0.3 and lemma 0.2 we have,

$$M_X(s) = \frac{\lambda^3}{2} \times \frac{\Gamma(3)}{(\lambda - s)^3} \quad (0.0.56)$$

$$= \left(\frac{\lambda}{\lambda - s}\right)^3, \text{ as } \Gamma(3) = 2! \quad (0.0.57)$$

$$= \left(\frac{\lambda}{\lambda - s}\right)^\alpha, \text{ for } \alpha = 3 \quad (0.0.58)$$

Therefore the MGF of  $X$  is same as the MGF of gamma distribution.

So from the theorem 0.4, the distribution of  $X$  is gamma distribution, i.e.  $X \sim \Gamma(\alpha, \lambda)$  with PDF,

$$f_X(x) = \begin{cases} \frac{\lambda^\alpha x^{\alpha-1} e^{-\lambda x}}{\Gamma(\alpha)} & x > 0 \\ 0 & \text{otherwise} \end{cases} \quad (0.0.59)$$

where  $\alpha = 3$ .

So we have from lemma 0.7 and equation

(0.0.54),

$$E[\Theta] = E\left[\frac{3}{\bar{X}}\right] \quad (0.0.60)$$

$$= 3 \times E\left[\frac{1}{\bar{X}}\right] \quad (0.0.61)$$

$$= \frac{3n\lambda}{3n-1} \quad (0.0.62)$$

So we calculate bias as follows,

$$B(\Theta) = E[\Theta] - \lambda \quad (0.0.63)$$

$$= \frac{3n\lambda}{3n-1} - \lambda \quad (0.0.64)$$

$$= \frac{\lambda}{3n-1} \neq 0 \quad (0.0.65)$$

Therefore  $\frac{3n}{\sum_{i=1}^n X_i}$  is not an unbiased estimator of  $\lambda$

Option 2 is not correct.

3) Now here we have our estimator  $\Theta$  and quantity to be estimated  $\theta$  as,

$$\Theta = \frac{2}{n} \sum_{i=1}^n \frac{1}{X_i} \text{ and } \theta = \lambda \quad (0.0.66)$$

Now the variance of  $\Theta$  is calculated using lemma 0.5 as,

$$Var(\Theta) = Var\left(\frac{2}{n} \sum_{i=1}^n \frac{1}{X_i}\right) \quad (0.0.67)$$

$$= \frac{4}{n^2} \sum_{i=1}^n Var\left(\frac{1}{X_i}\right) \quad (0.0.68)$$

Using corollary 0.8.1,

$$Var(\Theta) = \frac{4n}{n^2} \times \frac{\lambda^2}{4} \quad (0.0.69)$$

$$= \frac{\lambda^2}{n} \quad (0.0.70)$$

The bias of  $\Theta$  from option 1 is given as

$$B(\Theta) = 0 \quad (0.0.71)$$

So we have,

$$MSE(\Theta_n) = Var(\Theta) + B(\Theta)^2 \quad (0.0.72)$$

$$= \frac{\lambda^2}{n} \quad (0.0.73)$$

Now,

$$\lim_{n \rightarrow \infty} MSE(\Theta_n) = \lim_{n \rightarrow \infty} \frac{\lambda^2}{n} \quad (0.0.74)$$

$$= 0 \quad (0.0.75)$$

Therefore,  $\frac{2}{n} \sum_{i=1}^n \frac{1}{X_i}$  is a consistent estimator of  $\lambda$ . Option 3 is correct.

4) Now in this option we have our estimator  $\Theta$  and quantity to be estimated  $\theta$  as,

$$\Theta = \frac{3n}{\sum_{i=1}^n X_i} \text{ and } \theta = \lambda \quad (0.0.76)$$

The variance of estimator similar to option 2 and using lemma 0.8 is,

$$Var(\Theta) = Var\left(\frac{3}{\bar{X}}\right) \quad (0.0.77)$$

$$= 9 \times Var\left(\frac{1}{\bar{X}}\right) \quad (0.0.78)$$

$$= \frac{9n^2\lambda^2}{(3n-1)^2(3n-2)} \quad (0.0.79)$$

The bias calculated from option 2 is

$$B(\Theta) = \frac{\lambda}{3n-1} \quad (0.0.80)$$

So we have,

$$MSE(\Theta) = Var(\Theta) + B(\Theta)^2 \quad (0.0.81)$$

$$= \frac{9n^2\lambda^2}{(3n-1)^2(3n-2)} + \frac{\lambda^2}{(3n-1)^2} \quad (0.0.82)$$

$$\lim_{n \rightarrow \infty} MSE(\Theta_n) \quad (0.0.83)$$

$$= \lim_{n \rightarrow \infty} \frac{9n^2\lambda^2}{(3n-1)^2(3n-2)} + \frac{\lambda^2}{(3n-1)^2} \quad (0.0.84)$$

Now in first limit multiply and divide by  $n^2$  and  $n \rightarrow \infty$  we get,

$$\lim_{n \rightarrow \infty} MSE(\Theta_n) = 0 \quad (0.0.85)$$

Therefore,  $\frac{3n}{\sum_{i=1}^n X_i}$  is a consistent estimator of  $\lambda$ . Option 4 is correct.

**Therefore option 1, option 3 and option 4 are correct.**
